WANTACE SOLUTIONS SPRINT

48-Hour Assignment — Worked Solution

CANDIDATE	DATE
Manipal Sai Segu	17 October 2026

Purpose: A structured solution based on the assignment brief and preparation guide provided in this conversation. It covers the Vardhan Steelware case and provides the required structure and draft content for Parts A–E.

Important fieldwork limitation: The brief requires a real-business interview, direct owner quotes, a hand-drawn process map, and permitted photos. These cannot be truthfully created from the fictional Vardhan case. Part A therefore contains a ready-to-complete audit section rather than fabricated evidence. Part D must be adjusted to reflect the actual audit.

Contents

Part	Deliverable
A	Real business audit worksheet, interview questions and process-map guidance
B	Vardhan Steelware requirement document: evidence, workflow, scope, data model, roles, reports, questions and risk
C	Account Executive handoff note
D	LinkedIn post and Meta ad drafts
E	Five-minute video outline and AI-use note template

Prepared using the supplied source material; no external business facts have been added.

PART A — AUDIT A REAL BUSINESS

Status: fieldwork required

Choose a business that makes, processes or repairs products—for example, a bakery that produces its own goods, tailoring unit, printing press, furniture workshop or small factory. A shop that only resells products does not qualify. Speak to the owner or manager for at least 20 minutes.

Audit notes — fill in after the interview

Field	Information to record
Business profile	Business name and area; products made, processed or repaired; approximate orders per day/month.
Order intake	How orders arrive: walk-in, phone, WhatsApp or other; who receives and records each order.
Order journey	Every step from enquiry to delivery and payment, including the person responsible at each step.
Current tracking tools	Register, order slips, whiteboard, spreadsheet, WhatsApp, Tally or another app.
Most frequent problem	The owner's specific example of what goes wrong most often.
Impact	Owner's actual estimate of time or money lost; do not invent a figure.
Two direct quotes	Write two exact owner statements in the language they used.
Evidence	Photograph a hand-drawn process map and at least two current tracking methods, with permission and personal details blurred.

Interview questions

• How many orders do you usually receive in a day or month, and what products do you make?

• Can you walk me through one recent order from the customer's first enquiry to delivery and payment?

• Who handles each step, and where is the latest status recorded?

• What happens when production is delayed, an item is damaged, or a customer changes an order?

• Which problem happens most often, and what does it cost in time or money?

• May I photograph your tracking method after hiding personal information, and may I share your business contact with the assignment team so they can thank you?

Process-map guide

Draw the actual observed steps by hand. A starting structure is: Customer enquiry → Order recording → Production/processing → Quality check → Packing → Delivery → Payment. Add the real people, tools, handoffs, delays and rework. Do not submit this generic sequence as an observed fact.

PART B — REQUIREMENT DOCUMENT

Client: Vardhan Steelware | Jagadhri, Haryana | Proposed Phase 1

1. Problem in the client's words

Suresh says, **“pata nahi chalta maal kahan atka hai”** and explains that when a customer calls, he has to call Ramesh for an update. He also says, **“Mujhe bas phone pe dekhna hai kaunsa order kahan hai.”** The primary problem is poor visibility into an order's current stage, not necessarily a lack of advanced software.

2. What the material shows

Finding	Evidence in the pack	Implication / caveat
Possible duplicate entries	Gupta Traders' 200-piece Kadai order appears as dispatched and pending. Jain Crockery's 150-piece Kadhai order appears twice.	Use unique order IDs and duplicate review. Confirm before merging; these may be repeat orders.
Partial dispatch	Mehra ordered 300 pieces; 180 were dispatched, then the remaining 120.	Support multiple dispatch records and show the outstanding balance.
Payment hold	Sharma's glass order is held; the sheet mentions ■1.8 lakh in old dues.	Display hold reason and who can clear it.
Outsourced polishing	Bansal's Tope order is awaiting return from polishing.	Track outsourced processing as a visible stage.
Quantity discrepancy	WhatsApp records 420 kg sent to Pappu, 1,180 pieces received and a 6 kg shortage.	Capture units and batches. Kilograms and pieces cannot be compared directly without a defined reconciliation method.
Missing / inconsistent data	One row has no customer; another uses 180 kg with no rate; dates and product names vary.	Validate required fields and standardise products, dates and units.
Return	Sharma's order has a return of -6 dozen due to dents.	Record a separate return transaction with reason and disposition.

Conflicting statements: Suresh estimates 60–70 orders per month while Kunal says the volume is higher. Kunal says online sales are growing 30% monthly, while Suresh says online is under 5% of the business. These claims need clarification rather than silent reconciliation.

PART B — CURRENT PROCESS & PHASE 1 SCOPE

3. As-is process (provisional; validate with Ramesh and the team)

Step	Current understanding	Gap to confirm
1. Enquiry	Distributor orders arrive by phone or WhatsApp.	Who confirms product, unit, rate and required delivery date?
2. Order entry	Kunal maintains a Google Sheet.	How are duplicate-looking rows identified? Who corrects missing fields?
3. Production	Goods are manufactured before finishing and dispatch.	Which production stages are tracked and by whom?
4. External polishing	Goods go to 4–5 outside polishers; material is weighed going out and counted coming back.	How are kg/piece differences and contractor batches reconciled?
5. Readiness / packing	Returned goods are prepared for dispatch.	Who checks quality, packing and defects?
6. Dispatch	Ramesh coordinates dispatch; partial shipments occur.	How are dispatch proof and remaining quantity recorded?
7. Payment / hold	Munshi ji uses Tally; some orders are held for old dues.	Who authorises and clears holds?
8. Status enquiry	Suresh calls Ramesh when customers ask for updates.	No single trusted status view is evident in the supplied pack.

4. Phase 1 — include

• Central order register with unique ID, customer, product, quantity, unit, rate, order date and source.

• Mobile-friendly status view with current stage, last update, update owner and delay/blocker reason.

• Partial dispatch and return records linked to the original order/item.

• Polishing batch log with contractor, quantities sent/received, units, dates and discrepancy status.

• Payment-hold flag and reason; exact payment handling to be confirmed with accounts.

• Basic role permissions and three exception-focused morning reports.

Explicitly out of Phase 1

AI sales forecasting, full ERP replacement, Tally migration, complex Amazon/Flipkart integrations, contractor logins and advanced inventory costing. First establish reliable order/status data and a workflow staff will actually use. Marketplace integration can be reconsidered after confirming the real online-sales need.

PART B — DATA MODEL, USERS & REPORTS

5. Proposed data model

Entity	Key fields	Relationship / rule
Customer	customer_id, name, contact, channel	One customer can have many orders.
Order	order_id, customer_id, date, source, status, hold_reason, created_by, updated_at	One order has many items and dispatches.
OrderItem	item_id, order_id, product_id, quantity, unit, rate	Every quantity must have a unit; missing rate must be explicitly flagged.
Product	product_id, name, size/variant, default unit	Standardise names without losing meaningful variants.
PolishingBatch	batch_id, item_id, contractor_id, sent_qty/unit/date, received_qty/unit/date, discrepancy	Track each batch separately; never subtract unlike units.
Contractor	contractor_id, name, contact, active_status	One contractor can process many batches.
Dispatch	dispatch_id, order_id, item_id, date, quantity, unit, reference	Multiple dispatches can fulfil one order item.
Return	return_id, order_id, item_id, quantity, unit, reason, date, disposition	Separate return transaction linked to original item.
Payment / Hold	payment reference/date/amount if needed; hold reason, raised_by, cleared_by	Confirm whether Phase 1 records payment data or only hold status.
User	user_id, name, role, permissions	Track who creates or updates each status.

6. Users and phone actions

Role	What they see and do
Suresh — owner / likely approver	View every order's stage, age, holds and exceptions on phone; open an order without calling staff.
Kunal — order coordinator	Create/edit orders, review repeated-looking records, correct missing data and monitor pending orders.
Ramesh — dispatch in-charge	Update stages, add notes, record partial dispatches and see ready/blocked work.
Munshi ji — accounts	Verify payment holds and agreed payment references; review returns and reconciliation exceptions.
Polishing contractors	No direct login in Phase 1 unless discovery proves it necessary; internal staff record send/receive details initially.

7. Three reports Suresh should open each morning

- **Pending by stage and age:** order, customer, product, quantity, current stage, days in stage, last update and responsible person.
- **Blocked orders:** payment holds, missing fields, delayed polishing and other blockers, with reason and next-action owner.
- **Polishing reconciliation:** contractor/batch, quantities sent and received with units, discrepancy and reconciliation status.

PART B — DISCOVERY QUESTIONS & RISK

8. Questions for the next call

Question	Ask
1. What is the correct monthly order count, and what counts as an order versus an order line?	Suresh + Kunal
2. Which statuses should be visible, and who can change each one?	Suresh + Ramesh
3. Can we walk through one normal order, one partial dispatch and one held order end-to-end?	Ramesh + Kunal
4. How do you distinguish a repeat order from an accidental duplicate?	Kunal
5. How are polishing quantities reconciled across kg and pieces? Is there a standard conversion?	Ramesh + Munshi ji
6. What does the reported 3–4% steel difference measure, over what period, and how is normal wastage recorded?	Munshi ji + Suresh
7. Who can create/clear payment holds, and what should the system display?	Suresh + Munshi ji
8. How should dents, returns and rework affect the original order status and remaining quantity?	Ramesh + Munshi ji
9. Why did the 2023 ERP fail in practice: complexity, training, workflow mismatch or something else?	Ramesh + Kunal
10. What is the minimum useful pre-Diwali pilot, and who can test it?	Suresh + key users

9. Biggest risk and mitigation

Risk: low adoption by the people who handle orders and dispatch. The earlier ERP ran for only three months, and Ramesh/contractors did not use it. If staff do not update the new system, the dashboard will be untrustworthy. Mitigate by involving Ramesh and Munshi ji in design, minimising required fields, making updates mobile-friendly, piloting a few real orders, training staff on familiar tasks, and measuring whether Suresh can answer order-status questions without calling another employee.

Suggested pilot success checks

- The owner can find the current stage and last update for a selected order without making a call.
- Each partial dispatch is linked to the original order and shows the remaining quantity in the same unit.
- Every polishing batch has sent/received quantities, units and a discrepancy status.
- The core users can update live pilot orders without recreating the previous ERP's complexity.

Do not promise a pre-Diwali launch date until workflow, users, data and minimum scope have been validated.

PART C — ACCOUNT EXECUTIVE HANDOFF

Decision-maker: Suresh Vardhan appears to hold final authority because he signs cheques; confirm the purchasing process.
Influencers: Kunal wants a modern system, integrations and AI forecasting; Munshi ji understands accounts and reconciliation.
Operational users: Ramesh, Kunal and Munshi ji. Ramesh's adoption is critical.

Core pain and evidence: Suresh cannot see where an order is stuck without calling Ramesh. The pack contains duplicate-looking rows, partial dispatches, payment holds, missing customer/rate fields and polishing discrepancies. Do not label every repeated row a confirmed duplicate or the reported steel difference a proven financial loss before verification.

What the client asks for versus what is needed: Kunal asks for Amazon/Flipkart integration and AI forecasting. The immediate need is a simple, trusted order-status workflow with partial dispatch, payment holds and outsourced-polishing traceability.

Likely objections and responses

• **“The previous ERP failed.”** Acknowledge the ■1.2 lakh experience; propose a small pilot designed with actual users.

• **“Staff will not use a complicated system.”** Demonstrate a mobile-first workflow with minimal entry and clear ownership.

• **“We need it before Diwali.”** Avoid promising a date until workflow, data and minimum scope are validated.

• **“We want AI and marketplace integrations.”** Record these as potential later phases after order data and status tracking are reliable.

Recommended next step: Arrange a workflow walkthrough with Suresh, Kunal, Ramesh and Munshi ji. Validate one normal order, one partial dispatch, one payment hold and one polishing batch. Agree status definitions, roles and pilot success measures before committing to delivery dates.

PART D — LINKEDIN POST & META AD

The brief requires both content pieces to be based on an insight from your own Part A audit and to anonymise the audited business. The copy below is a provisional draft based on the order-visibility theme in the supplied case; revise it after your real audit.

1. LinkedIn post (under 150 words)

A delayed order is not always a production problem.

Sometimes, the real issue is that nobody has one reliable answer to a simple question: **“Where is this order right now?”**

When updates are spread across paper registers, spreadsheets and WhatsApp messages, teams can spend time chasing information instead of moving work forward. Partial dispatches, outside processing and payment holds make the picture harder to follow.

A practical first step is not always a large ERP or an AI dashboard. It may be one shared order record, clear status updates and a short list of exceptions that need attention today.

Factory owners: if a customer asks for an update right now, can your team answer without making three calls?

2. Meta ad

Language: Hinglish. It may suit owner-led businesses where Hindi/Hinglish is used in day-to-day operations; validate the choice during Part A.

Primary text: Order ka status jaanne ke liye baar-baar phone karna padta hai? Production, polishing aur dispatch updates ko ek simple view mein track karein. Pending orders aur blockers ko jaldi identify karne mein madad paayein — bina shuru se complex ERP laane ke.

Headline: Har Order Ka Status, Ek Jagah

Creative concept: Split-screen image: on the left, scattered paper notes and WhatsApp updates; on the right, a clean mobile order list with “In Production”, “At Polishing”, “On Hold” and “Dispatched”. Avoid unsupported promises such as zero delays or guaranteed revenue increases.

PART E — VIDEO OUTLINE & AI USAGE NOTE

Record a five-minute video with your camera on. Speak naturally in Hindi or English rather than reading a script.

Time	What to cover
0:00–1:30	What surprised you during the real-business audit; use one specific observation from your own visit.
1:30–3:15	The most important thing the Vardhan pack reveals beyond the client's explicit request—for example, the previous ERP adoption problem, partial dispatches, payment holds or unit-reconciliation ambiguity.
3:15–5:00	One requirement-document decision you would change with another day, why, and what evidence you would collect.

AI usage note — 5–10 lines; fill in truthfully

• **Tools used:** name only the tools you actually used.

• **Tasks supported:** for example, structuring, reviewing the supplied records or editing.

• **Independent contribution:** describe your own observations, decisions and verification.

• **One incorrect or generic output:** give a real example; do not invent one.

• **Correction:** explain what you checked and changed.

• **Human judgement required:** real interview, quotes, photos and resolving ambiguity.

• **Final verification:** state what you personally checked before submission.

FINAL SUBMISSION CHECKLIST

• Part A: real 20-minute interview, two exact owner quotes, hand-drawn process-map photo and at least two permitted tracking-method photos.

• Part B: final requirement section no longer than four pages.

• Part C: final handoff note no longer than half a page.

• Part D: revise using the actual audit and do not name the audited business in public content.

• Part E: five-minute video link and truthful 5–10-line AI note.

• Email body: business name, area and owner's phone number, shared only with permission.

This PDF is a worked solution based on the supplied assignment materials. The real-business evidence required by Part A remains to be added before submission.
